Did you know?

Why do we have different blood types?

Answer: Blood types are like different versions of a recipe. Some people have “Type A” markers on their red blood cells, others have “B,” some have both, and some have none at all!

Activity: Fun fact: Knowing your blood type is important so doctors can give you the right kind if you need more!

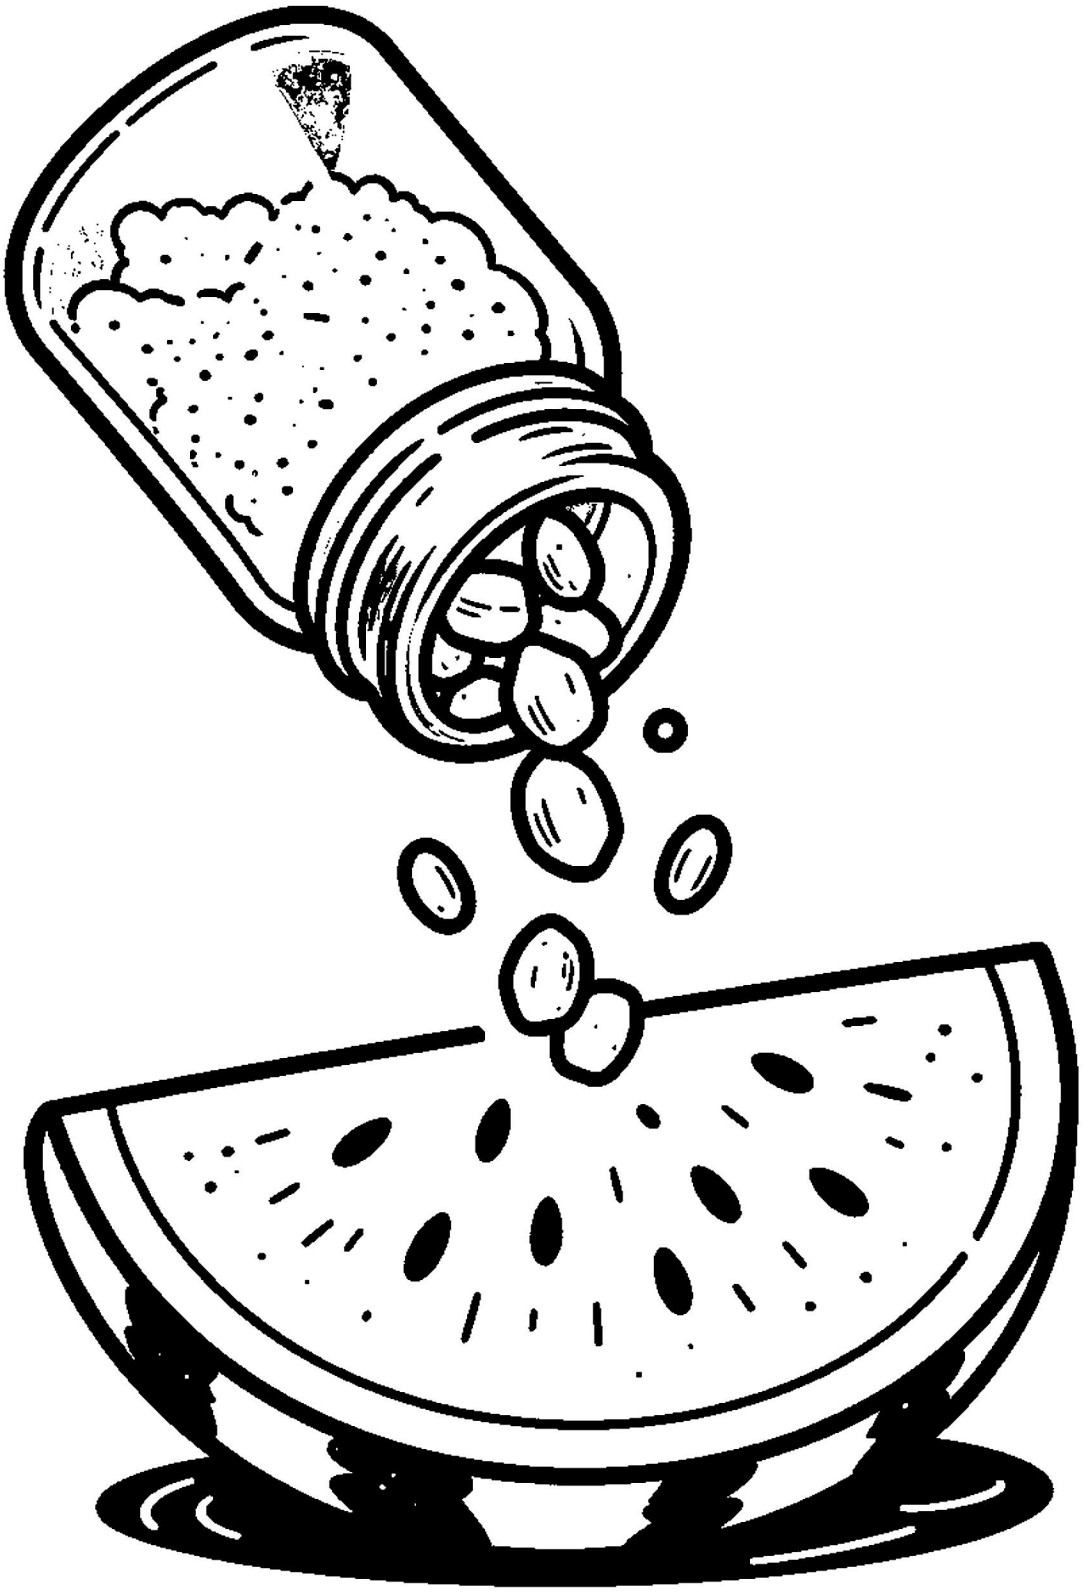

Did you know?

Why is the atmosphere important for life?

Answer: The atmosphere acts like a blanket. It keeps us warm, protects us from space radiation, and provides the oxygen we need to breathe.

Activity: Fun fact: Without an atmosphere, the sky would be black even during the day!

Did you know?

Why does salt make food taste different?

Answer: Salt blocks some of the bitter tastes in food and enhances others, making flavors like sweetness or savoriness stand out more.

Activity: Try this: Taste a piece of cucumber without salt, then add a pinch—does it taste “brighter”?

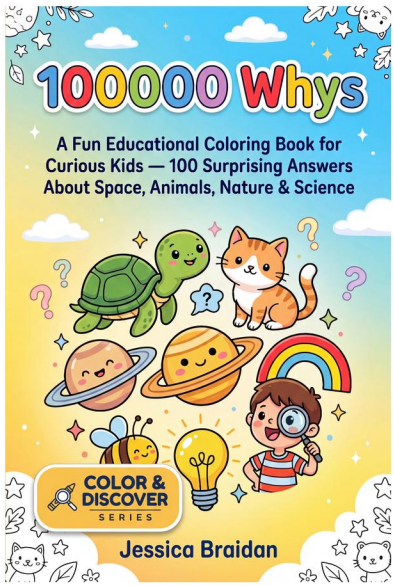

Did you know?

Why does it rain?

Answer: Water evaporates from oceans and forms clouds. Tiny droplets in a cloud bump together and grow. When they get too heavy to float, they fall as rain!

Activity: Try this: Before it rains, put a straight-sided cup outside, then measure the water with a ruler afterward!
