

Did you know?

Yi qi: The Bat-Winged Dino

Fact Explained: Yi qi was a tiny dinosaur with wings made of skin, like a bat's, instead of feathers! A long, thin rod of bone or stiff cartilage grew from each wrist and helped hold the skin wing open. Scientists think it may have glided from tree to tree. It lived in China about 159 million years ago and weighed only about 13 ounces (380 grams), about as much as a can of soup.

Wow Factor: Yi is the shortest dinosaur name ever — just two letters! Yi qi means 'strange wing' in Chinese.

Dino Challenge: Spread your fingers wide and imagine skin stretched between them. Flap your hand gently — what would your 'wing' be good for?
